

ABSTRACT

For years, farmers have eminently planned the agricultural production system. They have used several agricultural practices; however, indigenous knowledge is the oldest practice that is used by farmers from over the world and is still apart of today's agricultural system. A research was conducted in the Sangre Grande community to investigate the use of indigenous knowledge in crop production. The challenges of this research include time, finance and reluctance of farmers to participate. The research determined that indigenous knowledge and its practices are still largely used by farmers in today's agricultural system. Some of the indigenous practices used by farmers were researched. The research concluded by recommending that indigenous knowledge and its practices are very useful in today's crop production system.
