

SUMMARY

The writer has been in the employ of a state-owned enterprise in the deep south of Trinidad for ten years. He has recognised the need for developing an appropriate quality control system to satisfy the needs of the civil engineering section of this company.

He has therefore undertaken the research of all relevant text books, journals, periodicals and other publications to develop the requirements for a proper quality control system applicable to the construction sector in Trinidad as a whole.

The discussion is very broad based and covers almost all considerations that are important in the development of a quality control programme.

These are assessed and evaluated and recommendations are made for developing a quality programme that would be appropriate to the environment under consideration.
