THE FEEDING VALUE OF CULL MY-SORE BANANAS FOR PIGS

INTRODUCTION

In the tropics a variety of crop products are used for feeding to livestock. Often these crop products are included in the rations of livestock in a haphazard way whenever such products become available. It is only relatively recently that a scientific approach to the use of these products has been made in an endeavour to guide those who utilise them for feeding to stock.

The present project sought to determine the digestibility of green Mysore bananas when fed to pigs, and from these values to assess their value as a food for pigs.
