PREVENTION OF NEEDLE STICK INJURY IN THE CLINICAL SETTING AMONG NEW REGISTERED NURSES

Authors: Smith –Kwanzaa Caimite, Alexis Avernel, Augustus Michelle, Brooks Dawn, Clarke Keshmer, Gangoo Sadna, Ramlal Christine, Singh Rabindranath, Ocho Oscar Noel.

OBJECTIVES

(i) To identify the level of compliance of new nurses’ towards standard precautions.
(ii) To identify gaps between the new nurses knowledge and their standard of practice.
(iii) To identify the application of preventative practice to reduce needle stick injuries among new nurses.
(iv) To identify the attitude new nurses’ towards standard precautions as a prevention for needle stick injuries.

METHODS

This was a quantitative descriptive study conducted among new Registered Nurses with less than three years’ experience at the San Fernando General Hospital. A total of 120 new Registered Nurses were employed during the period under review and the entire population was used as the sample. A 26 item instrument was used to collect data which were analyzed using SPSS version 20.

RESULTS

Most of the respondents 59 (49.2%) were between the ages 20-<30 years and 88 (73.4%) were female. The most common years’ experience was 53 (44.2%). Almost half 54 (45%) respondents had experienced a needle stick injury with the most common exposure being while in use (17.5%) and recapping needles (21.5%). A total of 49 (40.8%) respondents had at least one to less than 3 needle sticks since employment and this was most common among staff on the medical wards. There was a moderate correlation between respondents knowledge about institution’s policies and need for training (r0.409, p0.01) and strong correlation between their perception of the need to be more vigilant and the quality of the sharps that they are provided with (r0.913, p0.01).

CONCLUSIONS

Avoidable practices such as non-adherence to standard precautions while using hypodermic needles are contributing factors to needle stick injuries. Prevention of NSI’s should be an integral part of occupational health programs in the work place. Therefore, mandatory training and evaluation of health care worker’s, knowledge and attitude regarding safety practices and proper use of available resources should be enforced when carrying out their duties in the clinical area.
