

11  
dextrine) and maltose were produced by hydrolysis at 50°C i  
in 10 minutes.

## ABSTRACT

Commercial production of this enzyme at a low cost  
is **Production of Alpha-Amylase from Bacillus subtilis**

Its use locally, is in the sugar industry, where it is  
utilised in the hydrolysis of starches present in the  
sugar cane. Its potential use in the Caribbean region,  
lies in the manufacture of liquid syrups from starches by  
the

**Vidiawatee Doodnath**

A study was carried out on the production of the  
enzyme, alpha amylase, by fermentation on a laboratory  
scale, using a bacterial strain of Bacillus subtilis B20  
strain. Fermentation was done in a standard lactose  
medium that incorporated soya meal, yeast extract, sodium  
caseinate and magnesium sulphate and adjusted to a pH of  
7.0. Enzyme production was achieved at 37°C within a pH  
range of 7-8 in 48 hours with continuous agitation. The  
enzyme was partially purified by precipitation with  
dehydrated alcohol at 4°C.

The activity of the purified enzyme was determined  
by the rate of starch hydrolysis, as reflected in the  
rate of decrease in iodine-staining capacity, which was  
measured spectrophotometrically. Activities in the range  
of 700-1000 amylase units were obtained for this enzyme  
by the hydrolysis of the starches of corn, potato,  
tapioca and arrowroot. Higher sugar intermediates (limit

dextrins) and maltose were produced by hydrolysis at 60°C in 10 minutes.

Commercial production of this enzyme at a low cost is feasible because of the simple nature of the process. Its' use locally, is in the sugar industry, where it is utilised in the hydrolysis of the starches present in the sugar cane. Its' potential use in the Caribbean region, lies in the manufacture of liquid syrups from starches by the alpha-amylase/amyloglucosidase-based process. Starches from corn, arrowroot and cassava can be used commercially to produce liquid syrups, just as the manufacture of corn syrups from corn starch, has revolutionised the sweetener industry in other parts of the world.
