

## **ABSTRACT**

The Report compared the environmental standards of the Broiler Meat Processing Industry of Trinidad and Tobago with those of the rest of the world. The main objective of the study was to determine the levels of implementation of policies in this industry. The problem therefore was how to determine the levels of policy implementation. The methods used to solve the problem were the use of primary and secondary methods of data collection. With regards to the former, a survey was conducted and information was collected from the Manager of two (2) major broiler-processing plants. On the other hand, the information from secondary data collection was gathered via the use of Internet and quick interviews with persons who performed studies on the environment. The results from the questionnaire were tabulated and later compared to international environmental compliance standards of Australia and Northern Ireland. The implications of the results were then analysed by stating the overall problem, providing a specific and generic solution(s), identifying the constraints to the solutions and suggesting how they could be relaxed.
